

Coating Systems Having an Anti-Corrosion Layer And a Powder Coating Layer

5

Abstract

A coating system is disclosed that comprises a corrosion inhibiting layer and a layer formed from a powder coating composition. The layer formed from the powder coating composition is a top coating layer and the corrosion
10 inhibiting layer is an undercoating layer. These layers, along with one or more other optional layers, form the coating system. The resulting coating system has been found to provide improved corrosion inhibiting properties and excellent bonding characteristics
